

PURUSHOTHAM VILASAGARAM

Test Automation Engineer | Quality Assurance Engineer | Software Development Engineer in Test
Hyderabad, Telangana, India | +91 9703201491 | purushothamvilasagaram95@gmail.com | linkedin.com/in/purushothamv

SUMMARY

Quality Engineer with 3.7+ years executing manual and automated end-to-end test scripts across multiple systems, products, and engineering teams. Skilled in Playwright (TypeScript) and Robot Framework (Python) automation, test planning, and automation strategy — identifying test cases suitable for automation based on risk, complexity, and frequency, then building and integrating them into CI/CD pipelines. Reduced manual regression effort by 60% through automation and has a track record of root-causing defects that engineering teams couldn't isolate manually. Comfortable across the full SDLC: requirements analysis, test design, automation, defect documentation, and release readiness in Agile teams.

KEY ACHIEVEMENTS

- Cut regression testing time by 60% by identifying high-frequency, high-risk manual test cases and converting them into automated suites integrated into CI/CD.
- Root-caused a critical logout defect that manual testing had missed, by replicating user behavior in automation and tracing the underlying API calls to the source.
- Carried full ownership of my test areas through two acquisitions (Albanero → Infor, GE Vernova → Velotric) — same product, same responsibilities, no handoff gaps.

TECHNICAL SKILLS

Automation & Languages: Playwright, TypeScript, JavaScript, Robot Framework, Python, Selenium WebDriver, Java, TestNG, JUnit, Cucumber (BDD)

API: REST Assured, Postman, JSON, Chrome DevTools Protocol (CDP)

CI/CD & Infra: Jenkins, GitLab CI/CD, Docker, Maven, Git

Process & Tooling: JIRA, Confluence, qTest, SQL, Agile/Scrum, Test Planning, Defect Management, AI-Assisted Testing, Data Governance

EXPERIENCE

Quality Assurance Engineer

Aug 2025 – Present

Velotric Software (Proficy product line; formerly GE Vernova, acquired by TPG, Mar 2026)

- Wrote and maintained Playwright + TypeScript automated test scripts for end-to-end industrial UI workflows, running suites on RDP-based VMs that mirror real deployment environments.
- Automated the iFIX Core SCU Windows desktop application using Robot Framework with Python, building end-to-end scripts that execute a scenario in iFIX Studio and then verify in Core SCU that the script actually achieved its intended result.
- Leveraged Claude (AI-assisted testing) to execute test cases in iFIX Studio, log results directly in qTest, and explore the application to draft new test cases, speeding up test design and execution cycles.
- Executed manual exploratory testing on newer or higher-risk features, then identified stable flows suitable for automation based on risk, complexity, and frequency, converting them into scripted regression coverage.
- Collaborated with developers and product owners to clarify requirements and resolve defects pre-release, and kept full ownership of my test areas through the GE Vernova → Velotric Software acquisition with zero handoff gap.
- Documented test coverage, automation scripts, and defects in JIRA and Confluence, giving leads clear visibility into feature readiness ahead of each release cycle.

Quality Assurance Analyst, Associate (prev. Software Test Engineer I)

Jan 2023 – Aug 2025

Infor India Pvt. Ltd. (joined via Albanero Dev Pvt. Ltd., acquired by Infor)

- Built the team's test automation framework from scratch in Java + Selenium WebDriver + TestNG, supporting reliable cross-platform and multi-instance test execution.
- Reduced manual regression time by 60% by converting high-frequency manual test cases into automated suites, then integrating them into CI/CD pipelines (Jenkins + GitLab) for continuous execution as the team scaled under Infor.
- Caught a critical logout defect by replicating user behavior through Selenium-Java scripts and capturing the underlying API calls, enabling developers to root-cause and fix it.
- Used Chrome DevTools Protocol (CDP) and Postman to inspect network traffic and validate API responses, surfacing backend defects invisible to UI-only testing.
- Expanded into data governance testing as the role grew — designing test cases for business-rule validation, data glossary, catalog, and lifecycle policies against Agile/SDLC requirements.
- Owned the defect lifecycle in JIRA from identification through root-cause triage, partnering with developers and data stewards.
- Reviewed peers' test cases and documentation to keep the team aligned on quality standards, and supported test estimation (Pre-L0/L0/L1) for cross-functional planning.

EDUCATION

B.Tech, Civil Engineering — JNTUH

2017 – 2020

Diploma in Civil Engineering — SBTET

2014 – 2017

CERTIFICATIONS

Selenium with Java (Udemy) • Selenium 101 (LambdaTest) • REST API Test Automation (Udemy)
